Remedial Course Enrollments and Student Outcomes in Maine's Public Higher Education Institutions

Amy F. Johnson
amyj@maine.edu

Executive Summary

College readiness remains a large policy challenge for both K-12 schools and higher education institutions. Students who need to pursue remedial coursework before being able to enroll in introductory college requirements face financial and logistical challenges that create barriers to degree progression. In an effort to gain additional information about the scale and context of the problem the University of Maine System and Maine Community College Systems were required to prepare four annual reports with information about the students entering their colleges directly from a Maine high school. These reports provided information on the overall proportion of these students who needed to enroll in remedial coursework, disaggregated by campus, by subject area (math, English, and overall), and by the high school from which they graduated. The second and subsequent reports also detailed retention and graduation outcomes for the students who enrolled in remedial courses in the prior years. This study compiled the results of the four reports in an effort to synthesize what may be learned from them.

The results confirm that a sizeable number of students are arriving at our public higher educations with inadequate preparation for college-level work, with one quarter of all entering recent graduates across both systems enrolling in at least one remedial course. The rates of remediation are higher in mathematics than in English and rates vary considerably across campuses. Some institutions have no students in remedial English courses; this points to varying selectivity in college admissions as well as differences in course pathways provided for supplemental preparation. Namely, in lieu of requiring remedial courses, some colleges offer credit-bearing “developmental” courses to provide additional instruction to students who are not deemed ready for college-level work. These

are not considered remedial because they qualify as elective credit toward a college degree and thus are not captured in the four years of reports.

Additional analysis of the remedial rates reported by high school showed that there are substantial challenges in using those data for making decisions. Many high schools are not included meaningfully in the reports as they do not have enough students entering the systems and enrolling in remedial courses to surpass minimum reporting thresholds. The rates of students entering Maine's public systems from any given high school who enroll in remedial math or English are related to the proportions of students deemed proficient in 11th grade testing, but are not related to any of a handful of other school-based factors. This may be partially due to the finding that the remedial rates in the reports may not be accurate or valid representations of the preparation of all students graduating from an individual high school, as the alumni choosing to enter the Maine public systems may not be typical of the broader graduating class.

In summary the study concludes that the reports confirm the size of the college readiness challenge in Maine, but do not provide helpful insights to high schools or post-secondary institutions into the sources of the problem or what should be done about it. Some recommendations are provided for alternate approaches for informing students and their high schools about college readiness.

Study Purpose and Methods

The impetus for this study came from a 2015 concept draft for proposed legislation (L.D. 1033 in Maine's 127th legislature), which called for compilation and analysis of three years of existing reports regarding the number of traditional-aged students enrolling in remedial coursework upon entry into Maine's public higher education institutions. The goal of the analysis is to look for relationships between the proportion of students at a high school requiring remedial coursework and other high school attributes, with the idea that identification of related factors may suggest potential areas for improvement to reduce future remedial rates.

To complete the study, researchers at the Maine Education Policy Research Institute (MEPRI) combined the six available reports from the University of Maine System (UMS) and Maine Community College System (MCCS) in 2013, 2014, and 2015 to produce three-

year average results for the data on remedial rates by campus and by high school. Results of the additional remedial student outcomes of persistence and graduation rates were combined for the number of years available. Contextual information about remedial placement practices, course policies, and future institutional plans was gathered through websites, report documents, and conversations with selected individuals at the institutional and system levels. The required January 2016 reports were released just prior to publication of this study, and results were incorporated selectively where feasible to update summary data tables.

Background and Context

Challenges of Remedial Courses

When entering college students are identified as needing additional academic preparation to be ready for introductory courses, there are negative impacts at multiple levels. The most direct challenges are for the students themselves. When students are required to enroll in remedial coursework—which, by definition, teaches content that is below college-level work—they incur the financial burden of paying additional tuition for work that does not earn credit toward degree requirements. Remedial courses also delay students’ ability to enroll in introductory college courses, as basic proficiency in math and/or writing is typically prerequisite. This in turn forestalls progression toward degree requirements (Bettinger & Long, 2005; Levin & Calcagno, 2008). Being identified as not college-ready also takes an emotional toll; students are sometimes surprised to learn that their high school preparation was inadequate for the expectations at their college. Learning that they are not ready sends a message that they are not “college material” and can undermine their confidence (Balduf, 2009; Connor, publication pending; Scott-Clayton & Rodriguez, 2012). And perhaps most importantly, the lack of preparation signaled by identification for remedial coursework is itself a fundamental underlying problem. Students lacking in the core skills of reading, writing, or mathematics are ill-prepared for the academic expectations in other college subjects. Some research suggests that remedial courses serve their purpose of getting students up to speed for college work (Bahr, 2008), but others suggest it is not necessarily a complete or robust solution, and may not

guarantee full preparation for academic demands (Martorell et. al., 2010). Taking these factors into consideration, it is not surprising that students who begin their post-secondary careers with remedial coursework have substantially higher drop-out rates than students who do not.

This situation also has a cost to colleges. The revenue from tuition and fees does not cover the full cost of education at the vast majority of public 2- and 4-year institutions, including all of those in Maine. Colleges must divert faculty from other courses or hire additional adjunct faculty to teach the remedial courses, which ultimately hurts their budgets. Moreover, the lower retention rates for students requiring remedial coursework also impact institutions as those students are needed to generate tuition and maintain sustainable class sizes in upper-level courses. Some institutions are investing additional resources into developmental education programming in order to mitigate these impacts and improve student outcomes, for example by hiring faculty with particular expertise in supporting adult math learners. These costs add to the overall expenses of supporting students who are not college-ready upon entry. The combination of all these negative impacts on students and on higher education institutions has created a heightened awareness of the problem as policymakers seek for better solutions.

Legislative Reports

In 2012, Maine's 125th Legislature passed a law to require the University of Maine System (UMS) and Maine Community College System (MCCS) to report annually on three pieces of data:

- 1) The number of students entering their institutions directly from high school that enroll in remedial English and/or mathematics classes during the fall semester, with results by each subject and each campus;
- 2) The number of students requiring remedial math or English reported by the high school that awarded their diploma; and
- 3) The retention and college graduation rates of students who were enrolled in remedial courses at each institution.

Notably, the legislation stipulated a reporting threshold of six students in order to protect student confidentiality; data points for five or fewer students were suppressed.

The first of these reports was issued in January 2013 based on data from students entering as first-time students directly from high school in the prior fall 2012 semester. Information on retention and graduation rates was available on this cohort and included in the subsequent reports beginning in January 2014. The Maine Maritime Academy (MMA) was included in the legislative reporting requirement, but does not engage in remedial coursework and therefore did not compile reports.

Explaining Differences Across Institutions

Variation across institutional remedial course rates can be attributed to three categories of differences. First, institutions vary in their selectivity. For example, as with the Maine Maritime Academy, the University of Maine generally admits students who are deemed ready for college-level work and this is reflected in their negligible remedial course rates. Other institutions partner with nearby adult education programs and refer to them their applicants who need additional preparation before enrollment in higher education. Others offer “bridge” programs in the summer between high school graduation and college enrollment, so that students are ready for college work in their first semester. In other words, part of the difference seen across colleges can be explained by the average first-semester preparedness of the students they enroll, which is impacted both by selectivity and by the provision of supplemental experiences before matriculation.

Secondly, additional variation exists because of different approaches for supporting students who are not ready for college-level work. These pathways rely on three basic types of course structures. The first category includes true remedial courses, which do not carry credit toward a college degree and are identifiable because they are numbered below 100. These remedial course enrollments are the focus of the annual UMS and MCCS reports that are the subject of this study. Another category of courses that are typically called “developmental” (but not remedial) are credit-bearing courses that serve as prerequisites to the traditional entry-level college English and math courses. These developmental courses *do* count toward graduation requirements as elective credit. However, the need to complete these courses as prerequisites to entry-level classes can still impede progress

toward meeting degree requirements. There is a third general approach for supporting students who have been identified as needing additional preparation for college-level work, in which students enroll directly into introductory level college classes but with additional academic supports or course modifications. Modifications can vary and include compressed courses (which cover remedial and college-level content in one semester, often requiring additional credits), co-enrollment in 1-credit supportive companion courses (sometimes modularized so students participate only in what is needed), and implementation of technology-based supports such as self-paced math tutorial programs. Common terminology for these various approaches continues to evolve, but they all share the property that students enroll directly into traditional introductory courses during their first semester. Institutions in UMS and MCCS that rely heavily on remedial courses will have higher reported rates in these legislative reports than institutions who place students into credit-bearing developmental courses, even if they have a similar number of students identified as not college-ready.

Lastly, a small amount of inter-institutional difference can be attributed to their assessment practices for determining remedial course placement. All of the institutions in the UMS and MCCS make an initial determination of college readiness based on SAT scores. That is, students who achieve certain threshold scores on the SAT-Math and SAT-Verbal exams are automatically considered prepared for entry-level college courses. Students with either SAT score below the established cut scores must take the relevant Accuplacer exam(s) for further placement determination. Institutions may vary both in the scores used for the minimum SAT screening and in the minimum Accuplacer results considered adequate for placement into introductory college courses. This means that two students at different colleges with identical SAT and Accuplacer scores could have opposite remedial course placement outcomes. However, it is unlikely that this is a large factor in explaining institutional differences. The Maine Community College System has standardized its cut scores for both SAT screening and Accuplacer assessment across its institutions. The University of Maine System institutions do not use identical scores, but the cut scores generally fall within a narrow range. As described above, UMaine does not offer remedial courses and thus does not have a stated placement assessment process. Most other UMS institutions use SAT screening scores of 500 each on math and verbal tests, which is just

slightly higher than the 480 math and verbal used in MCCS. Two institutions use SAT-math screening scores of 480 and 490, and one uses an SAT-Math of 550. All use an SAT verbal of 500 except for USM which places all incoming students into the introductory-level College Writing course regardless of SAT score. Variation in Accuplacer scores is more difficult to compare as only some institutions have their placement score matrices clearly posted on their websites; however, a recent report showed little variation (Maine College Transitions Working Group, 2012 report unpublished), and it is unlikely that policies have changed dramatically since then. While this variation in scores may present other challenges to prospective students seeking consistent information it does not greatly influence differences in institutional remedial placement rates.

It is noteworthy that 11th grade assessment score of 1142 that has been established as signifying proficiency is not the same as the scores used by post-secondary colleges to pre-screen for college readiness. A score of 1142 aligns to an SAT-Reading score of 460, an SAT-Writing score of 450, and an SAT-Math score of 460¹.

Findings

Institutional Data

As shown in Table 1, the rates of enrollment in remedial courses varied considerably across institutions. The proportion of students enrolling in remedial English courses ranged from 0% to 35% across colleges and was 12% overall across both systems over the four years of reporting. The proportion of students enrolling in remedial mathematics courses was higher than for English, ranging from 0% to 55% across colleges, and was 24% overall across both systems.

High School Data Representation

Availability of High School Reports

As is consistent with recommended best practice, the legislation establishing the reports set a reporting threshold of five students to preserve confidentiality. Appendix A contains the complete language from LD 1645, the legislative action initiating the reports.

Not all college-going students enter higher education in the fall semester directly following their high school graduation year and only some of those students enroll in one of Maine’s public institutions in the Maine Community College System or University of Maine System. When the data suppression rules are applied, less than half of Maine schools were able to receive information about the remedial course needs of their graduates. Table 5 provides information about the proportion of high schools that had reportable data on the total unduplicated number of their graduates who needed to take at least one remedial course upon entry into Maine’s public systems.

Table 5. Representation of Maine Schools in Reports of Overall Number of Students in Remedial Courses

School Type	N	Percent of Schools with UMS Data Reported				Percent of Schools with MCCS Data Reported			
		2013	2014	2015	2016	2013	2014	2015	2016
Public (All types)	128	32%	23%	8%	6%	52%	48%	45%	42%
Private - 60% Public	11	45%	36%	0%	0%	36%	64%	27%	27%
All Other Private	40	29%	39%	0%	0%	0%	0%	0%	0%
Adult Ed/GED*	11	30%	20%	0%	0%	10%	10%	10%	10%
Home Schooled	1	0%	0%	0%	0%	0%	0%	0%	100%
Total	191	32%	27%	5%	5%	38%	37%	33%	31%

* The MCCS combined all adult education / GED students into a single "school"; no individual programs received a report, but the overall numbers were reported each year.

The representation of each school may differ from year to year. In the first three years of reporting only one school in the state received all six of the possible reports, and an additional nine schools received five of the six possible reports. The remaining 95% of schools had four or less reports generated.

Furthermore, Table 5 reports schools that had information reported on the total number of students requiring remedial coursework of *any* type. Yet reporting is most helpful to schools when they are also able to discern whether the remediation was required in math or English. This additional level of disaggregation was suppressed for many schools, as the subgroups typically fell below five students. Table 6 illustrates the very low representation of schools whose reports included adequate detail to identify the type of remediation their graduates needed.

Table 6. Representation of Maine Schools: Reports of Students in Specific Remedial Courses

School Type	N	Percent of Schools Receiving a UMS Report				Percent of Schools Receiving a MCCS Report			
		2013	2014	2015	2016	2013	2014	2015	2016
Public (All types)	128	27%	20%	4%	5%	20%	22%	17%	12%
Private - 60% Public	11	45%	18%	0%	0%	9%	27%	9%	9%
All Other Private	40	29%	39%	0%	0%	0%	0%	0%	0%
Adult Ed/GED*	11	30%	20%	0%	0%	0%	10%	10%	0%
Home Schooled	1	0%	0%	0%	0%	0%	0%	0%	0%
Total	191	28%	24%	3%	4%	14%	17%	12%	9%

It is noteworthy that the rates of reporting both overall and subject-specific remediation in UMS dropped substantially in 2015 and 2016 compared to the two earlier years. In 2013 and 2014, the report applied a generous interpretation of the data suppression rules and included cell counts with zero students despite this being under the threshold of 5 students. This allowed interpolation of data for other missing cells, and resulted in a far greater number of schools receiving information about student outcomes. When data suppression was tightened to a more literal interpretation of the law in the January 2015 and 2016 reports, there was much less information available.

Representativeness of Student Data

In addition to concerns about the number of schools that do not have full results in the annual reports, the analysis raises additional questions about the validity of the school reports that *are* complete. In some schools, the proportion of graduates entering either public college system is small. For example, there were 70 high schools whose MCCS remedial data reports were based on 20% or less of the graduating class. In 11 of these schools the reports were based on 10% or less of the graduating class. The sorting of high school graduates into colleges is non-random; specifically, students who begin their post-secondary careers at a community college are more likely to have lower GPAs and SAT test scores than those who enter the UMS system or private colleges. They are also more likely to come from lower income households. Thus the accuracy of the MCCS reports in depicting the ability of a school to prepare students who are college-ready hinges on whether the students entering the MCCS are typical of all graduates of the school. This is not a solid assumption for many schools and particularly for schools in wealthier communities. To a lesser extent the same limitations hold true for the UMS reports.

When outcomes for students entering UMS and MCCS from any given school are combined the results are more likely to be representative. This reflects a greater share of any given graduating class and includes a broader variety of students. Appendix B provides summary results of the UMS and MCCS results combined over the first three years of reporting, to provide average results for students entering each system from a public high school. The eleven private schools with 60% or more publicly funded students are also included, but no other private school had enough students entering either system and

enrolling in remedial courses to trigger a report with outcomes data. The final column provides an overall remedial rate for students entering both systems. This calculation was only provided for schools that had at least one remedial report in each system over the three years. That is, the school must have had enough students entering into each system and enrolling in remedial courses to have a calculable overall remedial enrollment rate. Of the 128 public high schools and 11 private high schools with public students, only 42 had a remedial report in each system. The numbers of schools with enough data to have calculable subject-specific remedial rate is even lower, with 30 schools having a reportable remedial math rate and only 13 schools with a remedial English course rate in each system.

Remedial Rate Relationships to Other Factors

The final task in the data analysis was to look for factors that appear to be related to the proportion of students needing remedial coursework from each high school. For the reasons explained above regarding the need for adequate representation in the data, correlations were analyzed using overall remedial rates in the combined UMS and MCCS systems. These data should be interpreted with caution, as the comparatively small number of schools with adequate data (only 42 schools out of 139 with publicly-funded students) weakens the power of the analysis. And more importantly, the 42 included schools are likely different in systematic ways from those who were not. Smaller schools and schools with lower proportions of graduates requiring remedial courses are less likely to be represented in the correlations because they were more often subject to suppressed data. This limits the ability to generalize the results and apply them to all schools in Maine. Nonetheless, Table 7 provides the results of bivariate correlations between the three high school remedial rates (overall, math, and English) and other potential variables of interest, where a value of 0 indicates no relationship and 1 is a direct relationship. Data for the analysis were compiled from the Department of Education's public data warehouse, including the college-going data reports in the Research and Reports section.

Table 7: Pearson's Correlations between Remedial Rates and Other Factors of Interest in Maine Publicly-Funded High Schools

	Overall Remedial Rate	Remedial Math Rate	Remedial English Rate
<i>Number of Schools Included in Data</i>	43	30	13
Overall Remedial Rate	--	.863**	ns
Remedial Math Rate	.863**	--	ns
Remedial English Rate	ns	ns	--
Percent of Students Proficient in Writing, Grade 11 MHSA	-.521**	-.519**	ns
Percent of Students Proficient in Reading, Grade 11 MHSA	-.436**	-.418*	ns
Percent of Students Proficient in Math, Grade 11 MHSA	-.527**	-.403*	ns
Overall Student Attendance Rate in 2012-13	ns	ns	ns
Percent Eligible for Free or Reduced Price Lunch in 2013-14	ns	ns	ns
Graduation Rate 2013-14	ns	ns	ns
Percent of Graduates Enrolling in College in Fall 2014 (National Student Clearinghouse)	ns	ns	ns

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed).

"ns" indicates the correlation is not significant

These results show that the relationship between overall remedial rates and math remedial rates is strong. This can be explained by the fact that students are more likely to require remedial math coursework than English across all institutions, thus math rates are a more powerful driver of the overall numbers. This raises the possibility of using overall remedial rates as a proxy for math outcomes, but not for English. In fact, remedial English rates are unrelated to any of the factors explored. This may be due to the variation in remedial course policies at different institutions, resulting in zero reported enrollments at USM, UMPI, and UMF where developmental and co-enrollment models are in use in lieu of remedial courses. To the extent that high schools tend to have stronger enrollment patterns with campuses that are nearby, some high schools may have higher or lower

remedial rates as a result of their connections to colleges with different developmental course pathways. This would weaken the correlational relationship between English remedial rates and other factors.

The relationships between 11th grade test scores and remedial course rates are moderate. The Pearson correlations range from -0.4 to -0.5, indicating that as the proportion of students determined to be meeting or exceeding proficiency standards at the end their junior year increases, the proportion of students needing to enroll in remedial courses decreases. This is perhaps expected, as the 11th grade assessment in Maine includes the SAT exam that is used in initial screening for college course placements.

Conclusions & Recommendations

The results of these data analyses illustrate both the need for information related to college readiness and the challenges inherent in compiling it. Large numbers of students graduating from high school and entering directly into a Maine public post-secondary institution—almost one quarter of all those enrolling—are determined to be unready for introductory college courses and placed into non-credit remedial work. The true extent of the problem may be even greater than that reported number, as students who are placed into credit-bearing yet developmental prerequisite courses also face challenges. The reports initiated in 2012 were an attempt to gather information to gain a deeper understanding of college readiness.

However, this study highlights the insufficiency of these reports to add useful knowledge. Circumstances dictate that the majority of high schools are unable to receive detailed reports about their students' remedial course outcomes; the combined effects of prudent data suppression policies and small numbers of students entering either public system from any given high school preclude it.

Aggregate reports of remedial coursework by each post-secondary institution may be informative as a way to track institutional trends over time. However, the data by themselves do not provide insights into the reasons for differences across colleges, nor do they point to suggestions for improvement.

In addition, the required reporting of follow-up outcomes (reported in the 1 year persistence and graduation rates for both systems, and longitudinal data on all cohorts in

MCCS) also has limited utility. The rates by themselves paint a story about the number of students requiring remedial courses who drop out of college. But without comparative data on the outcomes for non-remedial students, the extent of the impact of remedial courses is not clear.

Given these results, it is recommended that the remedial course reporting requirement be allowed to lapse at the end of June 2016 as is established in statute. Continued reporting is not likely to yield additional insights.

However, the results of the correlational analysis suggest a possible alternate approach to providing schools with actionable information about their students' college readiness. The moderate relationship between remedial rates and 11th grade proficiency points to the potential to provide feedback as part of the high school assessment process rather than waiting until college enrollment. One way to potentially improve communication about college readiness would be to establish uniform SAT scores for pre-screening at all UMS and MCCS campuses, as the MCCS already does. These cut scores could then be included in 11th grade score reports and explain whether each student's results indicate that the student would be at risk of needing remedial coursework upon entry into the MCCS or UMS. This would provide a clear and consistent message to both students and high school leaders, and may create opportunities for new course approaches during the senior year to improve students' chances of testing out of remedial work. This change would be even more impactful if the scores used for pre-screening in UMS aligned more closely to the scores used to determine high school proficiency as that would eliminate a potential source of confusion.

However, this seemingly straightforward concept belies the complexity of the situation. Institutions have strong opinions about their course placement policies, which have evolved over years under much scrutiny and analysis. Differences in cut scores reflect institutional variation in pathway designs (i.e. remedial vs developmental coursework) as well as different levels of rigor and expectations for introductory college course content. Furthermore, the gap between high school proficiency determinations and college expectations reflects long-standing differences between K-12 and postsecondary cultures, which will not be bridged overnight. However, a development on the horizon gives reason to hope. The SAT exam is on the verge of major changes and a revised test will begin being

administered in March 2016. As part of the change, the new exam will have a different scoring system. At present, alignment of the two exams has not been analyzed as data is needed from the initial test administrations in order to create concordance tables comparing old and new exam scores. However, in the coming years the changes in the SAT will force institutions to revisit their course placement assessment policies. This creates a moment of change where it may be possible to establish more commonality within and across the systems.

In conclusion, additional work remains to be done to fully understand the causes, effects, and solutions for Maine's college readiness gap. However, it is not advisable to extend the current remedial course reporting requirements as they are not equipped to contribute to the effort.

STATE OF MAINE

IN THE YEAR OF OUR LORD
TWO THOUSAND AND TWELVE

S.P. 544 - L.D. 1645

An Act To Require the Maine Community College System, the University of Maine System and the Maine Maritime Academy To Report the Number of Students Enrolled in Remedial Courses

Be it enacted by the People of the State of Maine as follows:

Sec. 1. 20-A MRSA §10012 is enacted to read:

§10012. High school graduates data; remedial courses

1. Remedial courses. Using information that is already collected by the Maine Community College System, the University of Maine System and the Maine Maritime Academy as part of the admissions and academic placement process, the President of the Maine Community College System, the Chancellor of the University of Maine System and the President of the Maine Maritime Academy shall annually compile the data so as to demonstrate:

A. The total number of traditional students who are enrolled in remedial courses in English language arts and mathematics, which must be disaggregated by campus and by subject area;

B. The name of each secondary school in the State from which a traditional student enrolled in a remedial course received a high school diploma and the number of those students from each of those schools; and

C. The retention and graduation rates for traditional students who were enrolled in remedial courses in English language arts and mathematics, which must be disaggregated by campus.

For the purposes of this subsection and subsection 2, "traditional student" means a student who has attended any accredited public school or private school in the State and received a high school diploma from a secondary school in the State or who has participated in a home instruction program pursuant to section 5001-A, subsection 3, paragraph A and who in the following academic year matriculates in the Maine Community College System, in the University of Maine System or at the Maine Maritime Academy.

2. Personally identifiable information. In reporting pursuant to subsection 3 the information compiled under subsection 1, the Maine Community College System, the

University of Maine System and the Maine Maritime Academy shall manage education records in compliance with the federal Family Educational Rights and Privacy Act of 1974, 20 United States Code, Section 1232g. Those public institutions of higher education may not make public any information that could identify an individual student and shall ensure that the purpose of reporting disaggregated data for students enrolled in remedial courses is to conduct research for the purpose of evaluating and improving education programs. To ensure that personally identifiable information that would make a student's identity easily traceable is not disclosed, the public institutions of higher education may not report disaggregated information compiled under subsection 1 if the total number of traditional students who received high school diplomas from the same secondary school and enrolled in the same remedial course at the same campus is 5 or fewer.

3. Report. Beginning with the 2012-2013 academic year, the President of the Maine Community College System, the Chancellor of the University of Maine System and the President of the Maine Maritime Academy shall each report the information compiled under subsection 1, including recommendations for strategies that may result in fewer students enrolling in remedial courses at postsecondary educational institutions and strategies for improving the retention and graduation rates for students who were enrolled in remedial courses. The reports must be submitted by January 1st of each year to the Commissioner of Education and to the joint standing committee of the Legislature having jurisdiction over education and cultural affairs. The Maine Community College System, the University of Maine System and the Maine Maritime Academy shall publish the annual reports on their publicly accessible websites.

4. Contingent repeal. This section is repealed July 1, 2016 unless the Commissioner of Education certifies to the Secretary of State, the Secretary of the Senate, the Clerk of the House of Representatives and the Revisor of Statutes before that date that the United States Congress has enacted legislation requiring public institutions of higher education to compile and report substantially the same data.

Appendix D: Variables and Abbreviations Used in the Report Tables

Variable Name	Description	Range	Source*
Variables in Appendix B, Columns for UMS and MCCS reports			
# Reports	Number of annual reports that included data on the overall remedial enrollments; only these reports were used in 3 year average remedial rates	0 to 3	Remedial reports
Total Enrollees per year	Number of Enrollees from the high school in the UMS or MCCS system per year, 3 year Average	0 to 51.8	Remedial reports
Overall Remedial Rate	Overall Remedial Rate in UMS or MCCS (Any Subject); Average overall remedial students divided by average total enrollees using all reports with useful data	0 to 81%	Remedial reports
Math Remedial Rate	Similar calculation to overall remedial rate, using average number of students enrolled in remedial math courses	0 to 74%	Remedial reports
English Remedial Rate	Similar calculation to overall remedial rate, using average number of students enrolled in remedial English courses	0 to 71%	Remedial reports
Other Variables in Appendix B			
Total Grads per Year, 3 Year Avg.	Average number of graduates per year in 2011-12, 2012-13, and 2013-14	10 to 269	Maine data warehouse
Approx. Percent of All Grads in Maine Publics	Proportion of the college-going students in 2011-12 through 2013-14 who entered the UMS or MCCS system (based on average graduation numbers, NSC college going rates in Fall 2014, and average enrollments per year into UMS and MCCS)	17% to 78%	Calculated
Overall Remedial rate, Maine Publics	Aggregate overall remedial rate using combined data from UMS and MCCS averages. Calculated only if at least one usable report was generated in each system.	13% to 66%	Calculated

Appendix D (cont.): Variables and Abbreviations Used in the Report Tables

Variables in Appendix C			
Variable Name	Description	Range	Source
9-12 Enrollment (2013-14)	High school enrollment in Grades 9-12 in 2013-14	47 to 1360	Maine data warehouse
Grad. Rate (2013-14)	4-year Graduation Rate reported for 2013-14	68.6% to 100%	Maine data warehouse
% College-going	Percent of Spring 2014 graduates enrolling in college in Fall 2014 according to National Student Clearinghouse (NSC) data	25% to 86%	Maine data warehouse
Writing proficiency rate (2011-12)	Percent of 11th Graders Meeting or Exceeding Writing Proficiency Standards in 2011-12	23.9% to 94.4%	Maine data warehouse
Reading proficiency rate (2011-12)	Percent of 11th Graders Meeting or Exceeding Reading Proficiency Standards in 2011-12	20.8 to 100%	Maine data warehouse
Math proficiency rate (2011-12)	Percent of 11th Graders Meeting or Exceeding Math Proficiency Standards in 2011-12	22.4 to 100%	Maine data warehouse
Attend. Rate	Average daily student attendance rate reported for 2012-13	67.9% to 100%	Maine data warehouse
Dropout Rate	Annual dropout rate reported for 2013-14	1.2% to 6.8%	Maine data warehouse
Percent Economically Disadv.	% of Students Eligible for free or reduced-price lunch in 2013-14	0.7% to 100%	Maine data warehouse

Abbreviation	Full Name	Location
CMCC	Central Maine Community College	Auburn
EMCC	Eastern Maine Community College	Bangor
KVCC	Kennebec Valley Community College	Fairfield
NMCC	Northern Maine Community College	Presque Isle
SMCC	Southern Maine Community College	South Portland
WCCC	Washington County Community College	Calais
YCCC	York County Community College	Wells
UMaine	University of Maine	Orono
UMA	University of Maine at Augusta	Augusta
UMF	University of Maine at Farmington	Farmington
UMFK	University of Maine at Fort Kent	Fort Kent
UMM	University of Maine at Machias	Machias
UMPI	University of Maine at Presque Isle	Presque Isle
USM	University of Southern Maine	Portland, Gorham and Lewiston
