Acknowledgements

We would like to thank the parents who participated in survey interviews; this report would not be meaningful without their time and their candid responses. We are grateful to Matt Galletta, Pascale Desir and Amy Dix from the Maine Department of Health and Human Services who provided valuable feedback on the survey report. Al Leighton and the dedicated team of interviewers at the Muskie School Survey Research Center tested and administered the survey. Greg Jolda and Tina Gressani were instrumental in the preparation of the survey sample.

The survey and report were supported with funds from the Cooperative Agreement between the University of Southern Maine and the Department of Health and Human Services. The views and opinions expressed in this report are the authors' and should not be attributed to collaborating organizations, funders, or the University of Southern Maine.

Executive Summary

The purpose of the annual Survey of Children Served by MaineCare is to monitor the quality of services delivered by MaineCare, the State's Medicaid and CHIP program. The 2012 survey examines the experiences of families with children who are enrolled in MaineCare using a standardized survey instrument—the CAHPS 4.0H Child Medicaid Health Plan Survey—which is designed to provide performance feedback to Medicaid fee-for-service and managed care plans by identifying areas of excellence as well as those in need of improvement.¹

The sample frame for the 2012 survey included children ages 0 through 17 years who were enrolled in MaineCare for at least 5 months between January and June 2012. Computer-assisted telephone interviews were conducted by trained interviewers from the Muskie School Survey Research Center between July and October 2012. Out of the total of 2,396 sampled households that were contacted, 1,029 interviews were completed for an overall response rate of 43%.

Key Findings

- MaineCare scores very favorably compared with national benchmarks on CAHPS measures of Getting Needed Care, Getting Care Quickly, and How Well the Child's Doctors Communicate—with ratings at or above the 75th percentile on all the composites and individual items. Overall ratings of the child's personal doctor, ratings of the child's specialist, and ratings of all the child's health care are also among the highest nationally.
- One measure of Getting Care Quickly declined from 2011 to 2012. Eighty percent of parents reported that they "Got non-urgent appointment for child at doctor's office or clinic as soon as thought needed" in 2011, versus 74% in 2012, a marginally significant change ($p < .10$). This measure merits ongoing monitoring to help maintain high levels of access to care.
- Further improvement may be needed related to MaineCare customer service. As in 2011, survey results showed that only half (50%) of parents said that customer service at MaineCare consistently provide information or help needed, and only 59% of parents said that customer service staff at MaineCare are always courteous and respectful. These customer service ratings are among the lowest nationwide.
- Care coordination is another area where the survey results suggest an opportunity for improvement. While 96% of families surveyed said they got the help they needed in contacting their child's school or daycare, only 41% said they got the help they needed to coordinate care among different providers. This was significantly lower than the national median of 62 percent.

¹ In 2011, the Centers for Medicare and Medicaid Services (CMS) released a set of 24 pediatric quality measures, the CHIPRA Core Measures, for use by state Medicaid and CHIP programs. The same year, MaineCare Services was awarded a CHIPRA Quality Demonstration Grant from CMS to improve the quality of care delivered to children. One objective of the grant is to pilot the collection and reporting the CHIPRA Core Measures. The MaineCare survey instrument and sampling methodology were revised in 2011 to comply with the CHIPRA measure specifications, and facilitate benchmarking of the MaineCare results other state Medicaid and CHIP programs that use the CAHPS 4.0 Health Plan Survey.

- Survey results show that an estimated 39% of children enrolled in MaineCare have special health care needs. This is twice the prevalence of special health care needs in the general population of children in Maine (19.4%) and nationwide (15.1%).²
- There were several CAHPS measures for which children with special health care needs (CSHCN) scored significantly lower than other children enrolled in MaineCare. Parents of CSHCN were significantly less likely to report that it was always easy to get needed care (62% versus 78%), that their child's doctor listened carefully (79% versus 88%), and that it was easy to get prescription medicines through MaineCare for their child (69% versus 80%). On the other hand, CSHCN enrolled in MaineCare were more likely to report that their doctor offered more than one treatment option (55% versus 38%), and were more likely to say they got help with care coordination (49% versus 30%).

Focus on Oral Health

The MaineCare program identified oral health and ensuring access to dental care as a priority, so several questions related to dental services were included in the 2012 survey.

- Nearly two-thirds (63%) of all children enrolled in MaineCare received dental services in the past six months, and about one in five (22%) had more than one visit with a dental provider. The overall rating of the child's dental care was quite high, with a mean score of 8.8 (out of 10), and 69% of respondents rating the quality of their child's dental care a "9" or "10".
- Parents reported that a majority of children have a usual source of dental care (79%), however these rates vary by age. Having a usual source of dental care was less common among children ages 5 or younger (62%), relative to children ages 6 – 12 and teens, who had rates of 91% and 86%, respectively.
- Fourteen percent of children with MaineCare coverage – or approximately 15,500 children -- had dental care that was delayed or not received at some time in the past 6 months. When asked for the main reason why their child's dental care was delayed, nearly half (47%) said it was because the dental provider refused to accept MaineCare, and other 9% said they could not afford to pay for care.

Recommendations

- We recommend continued administration of the Child CAHPS 4.0H Child Medicaid Health Plan Survey in 2012 and beyond to allow for continued monitoring of patient experience with the MaineCare program. Repeat administration of the survey will also allow for the computation of trend results in future years, and will ensure that the MaineCare program comply with federal CHIPRA measure reporting requirements.³

² Population prevalence from the National Survey of Children with Special Health Care Needs. NS-CSHCN 2009/10. Data query from the Child and Adolescent Health Measurement Initiative, Data Resource Center for Child and Adolescent Health website. Retrieved [02/5/2012] from www.childhealthdata.org.

³ Annual reporting of the CHIPRA Core Measures, including the CAHPS survey, is a deliverable for the CHIPRA Quality Demonstration Grant described above.

- We recommend that MaineCare administrators explore using strategies described in the [CAHPS Improvement Guide](#) available from the Agency for Healthcare Research and Quality (AHRQ) to address areas for potential improvement identified in the 2012 survey.⁴

Suggested strategies to improve satisfaction with customer service include:

- implementing “listening posts” to systematically collect and regularly review complaints and compliments from members,
- convening a Patient and Family Advisory Council to provide input on MaineCare program development and evaluation, and
- implementing a service recovery program that provides protocols and training on how to respond to member dissatisfaction.

Strategies for improving care coordination and access to needed care include:

- ensuring that MaineCare providers have up to date information about the rules and requirements for prior authorization, which would help to speed up the referral process and minimize denied referrals.
- encouraging the participation of pediatric practices in MaineCare’s new Health Homes Initiative, in which qualified practices will receive financial incentives to partner with a Community Care Team and to provide comprehensive care management and care coordination to MaineCare members with specified chronic conditions.⁵

Purpose

The purpose of the annual Survey of Children Served by MaineCare is to monitor the quality of services delivered by MaineCare, the State's Medicaid and CHIP program. The 2012 survey examines the experiences of families with children who are enrolled in MaineCare using a standardized survey instrument—the CAHPS 4.0H Child Medicaid Health Plan Survey. The Consumer Assessment of Healthcare Providers and Systems (CAHPS) survey is designed to provide performance feedback to Medicaid fee-for-service and managed care plans by identifying areas of excellence as well as those in need of improvement.⁶ In addition to the standardized CAHPS items, MaineCare program managers also selected other areas of focus to include in the survey, such as access to and satisfaction with dental services, health behaviors of children enrolled in the program, and access to employer-sponsored insurance.

The 2012 survey is also designed to capture differences in the experience of care among families with children enrolled in MaineCare through different eligibility categories, and among families who have children with a chronic condition. The purpose is to see if there are certain groups of MaineCare members whose needs are not getting met, or who may benefit from targeted interventions.

Children's eligibility for MaineCare is determined based on their age, household income and whether or not the child has a disability. We classified children into the following three general eligibility categories:

1. **Medicaid**, which covers infants under age 1 with household income up to 185% of the Federal Poverty Level (FPL), ages 1 through 5 up to 133% of the Federal Poverty Level (FPL), and children ages 6 through 18 up to 125% of the FPL.⁷
2. **Medicaid Expansion**, which covers children ages 1 to 5 years of age with household income between 134% and 150% of the FPL, and children ages 6 through 18 with income between 126% and 150% of the FPL; and
3. **Separate Child Health Program (CHP)**, which covers infants under age 1 with household income from 185% to 200% of the FPL, and children ages 1 through 18 years of age with household income from 151% to 200% of the FPL.

Though all children enrolled in MaineCare receive the same benefits, there are several distinctions between these eligibility categories that could lead to differences in experience of care. First, children enrolled in the Medicaid category generally live in the poorest households, and therefore likely experience the most financial hardship and more barriers to accessing care. Second, parents of CHP enrollees pay monthly premiums of \$8 to \$64, depending on their family income, whereas there are no premiums charged for Medicaid Expansion or Medicaid enrollees. (A question in the survey specifically addresses the issue of whether the premium payments pose a hardship for these families). A final distinction, unrelated to experience of care, is that funding for children enrolled through the Medicaid Expansion and CHP eligibility categories comes from the federal CHIP program. Appendix A

⁶ For more information on the CAHPS survey, see: <http://www.cahps.ahrq.gov/Surveys-Guidance/HP.aspx>

⁷ Note that children up to age 18 who have a disabling condition are also eligible for MaineCare, with income eligibility limits that are greater than 200% of the FPL. For the purposes of the survey, these children are included in the Medicaid category.

summarizes the income eligibility guidelines, premium payments, and funding source for all three eligibility categories included in this report.

Findings from this report will be used to improve understanding of the needs of children enrolled in MaineCare, to develop quality improvement initiatives, and to satisfy MaineCare reporting requirements for the federal Medicaid and CHIP programs.

Methods

The 2012 Survey of Children Served by MaineCare was fielded according to instructions provided in the CAHPS 4.0 Health Plan Survey and Reporting Kit, Medicaid version.⁸ The sample frame included children age 17 years or younger who were enrolled in MaineCare for at least 5 months between January and June 2012. One child per household was randomly selected so that no family would be interviewed about the experience of more than one child. To reduce respondent burden, children living in households that participated in the 2011 survey of children with MaineCare coverage were excluded from the sample; children living in households where a child had recently died were excluded, as were children where no adult parent or guardian could be identified (i.e. children in state custody). A total of 114,147 eligible children were included in the final sample frame.

To ensure adequate sample size to separately analyze children receiving benefits through the CHP eligibility category and of children who have a chronic condition, we used a stratified random sample design that over-sampled these two groups. Children with a chronic condition diagnosis were identified during the sampling process using diagnosis codes from MaineCare claims for outpatient, inpatient and Emergency Department visits. Note that the actual determination of whether a child has a chronic condition in the CAHPS survey is made based on responses to a five-item CSHCN Screener (described below). The purpose of using diagnosis codes in the sampling process is to identify children in the sampling frame who are more likely to screen positive for a chronic condition, reducing the total sample size needed to obtain a sufficient number of children with chronic conditions for analysis and reporting.⁹

The final sample for the 2012 survey included 2,396 target children living in distinct households. The sample included 745 children enrolled in the CHP eligibility category of MaineCare, and 1,611 who were identified as having a chronic condition diagnosis in the claims data.

The survey instrument included all the core questions from the CAHPS 4.0 Child Medicaid Health Plan Survey, as well as the Children with Chronic Conditions item set. Questions addressing additional priority topics identified by MaineCare Services were inserted after the CAHPS questions. The complete survey instrument is included in Appendix B. Consent to participate in the survey was obtained verbally through the use of a script; all survey protocols, including the survey instrument and consent script, were reviewed and approved by the University of Southern Maine Institutional Review Board.

⁸ Available at: <https://www.cahps.ahrq.gov/CAHPSKit/Healthplan/HPChooseQx2.asp>

⁹ This is referred to as the “Enriched Sampling Approach” in the CAHPS guidance. For more information, see [Fielding the CAHPS Health Plan Survey 4.0: Medicaid Version. Sampling Guidelines and Protocols for Surveying Adults and Children.](#)

Computer-assisted telephone interviews were conducted by trained interviewers from the Muskie School Survey Research Center between July and October 2012. Of the 2,396 sampled households that were contacted, 1,029 interviews were completed for an overall response rate of 43%. Table 1 displays a summary of the characteristics of target children living in households with completed interviews (n=1,029), and a comparison to the eligible population (N=114,147). As noted above, children in the CHP eligibility category and those with a chronic condition diagnosis were oversampled to ensure adequate sample sizes for these subgroups, and are therefore more likely to be included in the sample. Weights were developed to adjust for the unequal probability of selection and for non-response. (More information on the development of sample weights is included in Appendix C).

Unless otherwise specified, all the results presented below are based on weighted data, so that they will more closely represent the prevalence of the population of children enrolled in MaineCare. All statistical tests were calculated using SAS version 9.2 with survey procedures that use the Taylor series linearization approach to account for the sample design and yield valid standard errors for the weighted data.

Table 1. Characteristics of Target Children and of the Eligible Population

Characteristic	% of Target Children n = 1,029	% of Population N = 114,147
MaineCare Eligibility		
CHP/Cubcare*	34.7	5.2

Region III (Aroostook, Hancock, Penobscot, Piscataquis and Washington)	29.7	26.6

* Denotes sub-populations that were oversampled.

Respondent Characteristics

The following table shows the unweighted distribution of respondents' age, gender, education level and relationship to the target child. Ninety percent of respondents were between the ages of 25 and 54, 88% were women, and 95% were the parent or step-parent of the target child. Forty-two percent of respondents have a high school education or less.

Table 2. Characteristics of Survey Respondents

Core CAHPS 4.0 Results and National Comparisons

The Core CAHPS questions focus on Getting Needed Care, Getting Care Quickly, Health Plan Information and Customer Service, and Overall Ratings (of child’s personal doctor, specialist, health care and health plan). We compared results from the 2012 MaineCare survey with data from children served by other state Medicaid programs using the 2011 CAHPS Database.¹⁰ In Table 3, we display Top Box scores for each of the CAHPS 4.0 Health Plan survey items and composite scores. Top Box scores represent the percent of respondents reporting the most positive response for a given composite, rating, or question item. For example, on scales that use “Always” to “Never”, the Top Box score is the percentage of respondents who chose “Always”; on rating scales where 0 is the worst and 10 is the best score, the Top Box score is the percentage selecting 9 or 10. Composite scores are calculated based on the average of all the items within a given composite. The last two columns in Table 3 are a summary rating using comparative data obtained from the national CAHPS database.¹¹ The summary rating indicates how the MaineCare results compare to Top Box scores from respondents served by 129 participating Medicaid managed care and fee for service plans in 14 different states. The Top Box summary rating categories are defined as follows:

Top Box Rating Categories

Symbol	Percentile
◆◆◆◆	90th percentile or higher
◆◆◆	75th - 90th percentile
■ ■	50th - 75th percentile
■	25th - 50th percentile
□	Less than 25th percentile

The results in Table 3 indicate that MaineCare scores very favorably compared with other Medicaid programs on CAHPS measures of Getting Needed Care, Getting Care Quickly, and How Well the Child’s Doctors Communicate—with ratings at or above the 75th percentile on all the composites and individual items. Overall ratings of the child’s personal doctor, ratings of the child’s specialist, and ratings of all the child’s health care are also among the highest nationally.

The only measures in Table 3 on which MaineCare scored below the national median were in the area of Health Plan Information and Customer Service. Half (50%) of parents said that customer service at MaineCare consistently provided information or help needed, and 59% of parents said that customer service staff at MaineCare were always courteous and respectful. These customer service ratings place MaineCare among the lowest scoring plans nationwide.

We also compared the 2012 CAHPS results against those from 2011 (not shown), and found only one notable change. Parents who reported that they “Got non-urgent appointment for child at doctor's office or clinic as soon as thought needed” fell from 80% in 2011 to 74% in 2012, a marginally significant decline ($p < .10$). Continued monitoring of this measure is advisable to identify access barriers.

<https://www.cahps.ahrq.gov/CAHPSIDB/Public/about.aspx>

+ Sample size for the 2012 MaineCare Survey is less than 100 for this item. Use results with caution.

Results are weighted to represent the entire population of children enrolled in MaineCare.

Children with Chronic Conditions CAHPS Results

The CAHPS survey also includes a supplemental set of items designed to measure health plans' performance in addressing topics that tend to be of more concern to families of children with chronic conditions. Questions in the CAHPS Children with Chronic Conditions item set are asked of all survey participants, regardless of the chronic condition status of the child, allowing for comparisons of children with and without a chronic condition. The measures include Access to Prescription Medicines, Access to Specialized Services, Family-Centered Care (including having a personal doctor who knows the child, shared decision-making, and getting needed information) and Coordination of Care and Services. We again computed the Top Box results for each measure, and compared them against national results from the CAHPS Database (Table 4).

The 2012 results show that MaineCare rates are comparable to other Medicaid programs on measures of Access to Prescription Medicine; about two thirds of families said it was always easy to get special medical equipment or devices, nearly two-thirds (63%) said it was always easy to get special therapy, and over half (58%) also said it was always easy to get treatment or counseling for their child. (A screening question precedes each one of the rating questions upon which these results are based, so that the ratings are based solely on the responses of respondents who said they had recently tried to get special medical equipment, etc. for their child).

The 2012 results for items related to Family-Centered Care are mixed. For the first measure of family-centered care – having a personal doctor who knows the child – ratings are comparable to national ratings. Eighty-six percent of families said their personal doctor talked to them about how their child was feeling, growing or behaving in the past six months. More than 90% also said their child's doctor understands how their child's health condition affects the child, and 89% said their child's doctor understands how it affects the family. The second measure of family-centered care is shared decision-making. Only 46% of parents said that their child's MaineCare provider offered more than one choice for treatment or care, a rating that is in the bottom quartile nationally. (For providers who did discuss treatment options, almost all families reported that the provider discussed pros and cons of each choice, and asked the parent which treatment they thought was best for their child.) The third measure of family-centered care is getting needed information. Eighty percent of families said they always had their questions answered by their child's providers, placing MaineCare providers in the 90th percentile nationally on this measure.

Care coordination is another area where the survey results suggest an opportunity for improvement. While 96% of families surveyed said they got the help they needed in contacting their child's school or daycare, only 41% said they got the help they needed to coordinate care among different providers. This was significantly lower than the national median of 62 percent.

The only statistically significant change in the chronic conditions measures from 2011 was in the proportion who reported their child's doctor spoke to them about how the child was growing, feeling and behaving, which declined from 91% to 86% (results not shown).

Table 4. 2012 MaineCare Child Survey CAHPS 4.0 Children with Chronic Conditions Results

Results are weighted to represent the entire population of children enrolled in MaineCare.

Children with Special Health Care Needs (CSHCN)

A group of particular interest is children with special health care needs (CSHCN)—defined as children who have or are at increased risk for a chronic physical, developmental, behavioral, or emotional condition and who also require health and related services of a type or amount beyond that required by children generally.¹² Several federal and state programs target CSHCN, including children in the foster care or adoption assistance programs (Title IV-E), Supplemental Security Income (SSI), Title V-funded care coordination services¹³, or services under a 1903(3) (3) option, known as the Katie Beckett option.

We identified CSHCN in our survey sample using the CSHCN Screener developed by Bethell, et al (2002).¹⁴ The CSHCN Screener is included in the CAHPS 4.0H Child Medicaid survey, and identifies children who experience at least one of five different health consequences: 1) Use or need of prescription medication, 2) Above average use or need of medical, mental health or educational services, 3) Functional limitations compared with others of same age, 4) Use or need of specialized therapies, and 5) Treatment or counseling for emotional or developmental problems. To qualify as a CSHCN, the following must all be present:

- The child must currently experience one of the five specific consequences noted above;
- The consequence must be due to a medical, behavioral, or other health condition;
- And the duration or expected duration of the condition is 12 months or longer.

An estimated 39% of all children who are currently enrolled in MaineCare meet the CSHCN screening criteria (Table 5). Of the five qualifying health consequences, use or need of prescription medications is the most prevalent at 29%, followed by above average use of services (21%), and current treatment or counseling for emotional, behavioral or developmental problems (18%).

The prevalence of children with special health care needs is significantly higher among children enrolled in MaineCare than in the general population of children in Maine. Data from a national survey conducted in 2009-2010 showed that 15.1% of children nationwide have special health care needs, and that 19.4% of all children in Maine have special health care needs.¹⁵ Children enrolled in MaineCare are almost twice as likely (at 39%) to have a special health care need compared with other children in Maine.

Table 5. Children with Special Health Care Needs Screener Results

Item	Results		
	n	%	95% CI
<i>Health consequence of child's chronic condition or special health care needs</i>			
Use or need of prescription medication	1013	29%	(28% - 32%)
Above average use or need of medical, mental health or educational services	993	21%	(18% - 23%)
Functional limitations compared with others of the same age	1016	14%	(12% - 16%)
Use or need of specialized therapies (occupational therapy, physical therapy, speech therapy, etc.)	1014	10%	(8% - 12%)
Treatment or counseling for emotional, behavioral or developmental problems	1001	18%	(16% - 20%)
<i>Child with Special Health Care Needs (experiences one or more of these health consequences)</i>	1023	39%	(35% - 42%)

n = unweighted sample size

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Differences in Experience of Care for CSHCN

Ensuring that children with special health care needs enrolled in MaineCare have adequate access to needed services is important not only for the health and well-being of these children, but also for the control of current and future MaineCare expenditures. By helping children and families to better manage their chronic conditions, MaineCare can help avoid the use of more costly emergency and hospital services.

To identify areas where MaineCare may be able to improve the quality of services delivered to CSHCN, we compared results for all of the CAHPS items included in Tables 3 and 4 for CSHCN and non-CSHCN. We found statistically significant differences ($p<.05$) between CSHCN and non-CSHCN for several CAHPS items, shown in the table below. Parents of children with special health care needs were significantly less likely to report that it was always easy to get needed care (62% versus 78%), that their child's doctor listened carefully (79% versus 88%), and that it was easy to get prescription medicines through MaineCare for their child (69% versus 80%). There is also evidence of lower overall satisfaction with MaineCare, as parents of children with CSHCN were less likely to give MaineCare a rating of 9 or 10 on the health plan rating scale. On the other hand, CSHCN enrolled in MaineCare were more likely to report that their doctor offered more than one treatment option (55% versus 38%), and were more likely to say they got help with care coordination (49% versus 30%).

Table 6. CAHPS Item Comparison of Children with Special Health Care Needs

Composite/Item	n	CSHCN	Non-CSHCN	CSHCN Comparison
Core CAHPS 4.0 Health Plan Item Set				
How often was easy to get needed care, tests or treatment for child (% "Always")	759	62%	78%	↓
Child's personal doctor listened carefully	710	79%	88%	↓
Rating of child's health plan (% responding "9 or 10" out of 10)	1012	57%	66%	↓
Children with Chronic Conditions Item Set				
How often was easy to get special medical equipment or devices for child (% "Always")	76	60%	81%	+
How often was easy to get prescription medicines for child through health plan (% "Always")	538	69%	80%	↓
Child's doctor or health provider offered more than one choice for child's treatment or care (% "Always")	724	55%	38%	↑
Got help from child's health plan, doctor's office, or clinic to coordinate child's care among different providers/services	391	49%	30%	↑

n = unweighted sample size

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Well-Child Visit Topics

Bright Futures is a comprehensive set of health supervision guidelines developed by multidisciplinary child health experts that provide a framework for well-child care from birth to age 21.¹⁶ These guidelines describe how often well-child visits should occur, immunizations, examinations, and screening that should be conducted at each visit, and monitoring of developmental milestones. In addition, the guidelines outline age-specific “anticipatory guidance” that should be provided to parents and their child at each visit—such as information about child-proofing the home for parents of infants, monitoring TV viewing for middle-school age children, or counseling adolescents to avoid drugs and alcohol. MaineCare Services adopted the Bright Futures guidelines as a standard of care for all pediatric patients in 1998. Use of the guidelines was encouraged by convening a group of pediatric providers to

¹⁶ Available at: http://brightfutures.aap.org/3rd_Edition_Guidelines_and_Pocket_Guide.html

develop clinical forms that were user-friendly, and by offering enhanced reimbursement rates for providers who used the forms.¹⁷

To examine the extent to which MaineCare providers follow Bright Futures recommendations for anticipatory guidance, we asked parents the frequency with which their children's primary care provider (PCP) talks with them or their child about selected health and behavioral issues during well-child visits.¹⁸

Table 7. Topics Discussed in Well-child Visits

Composite/Item	n	Results	
		%	95% CI
<i>In the last 6 months, did your child's personal doctor talk with you about... (% "Always")</i>			
Physical activity or exercise (age 3+)	610	77%	(73% - 82%)
Sugar-sweetened drinks	693	73%	(68% - 77%)
Nutrition and diet	700	71%	(67% - 76%)
Risks of second hand smoke	696	69%	(65% - 74%)
Weight	701	69%	(64% - 73%)
Television viewing/screen time	692	63%	(58% - 68%)
Use of tobacco products (age 8+)	381	57%	(50% - 63%)
Mental Health (age 3+)	603	53%	(47% - 58%)
Drug or alcohol use (age 8+)	380	52%	(46% - 59%)
Reproductive health (age 8+)	371	44%	(37% - 51%)

n = unweighted sample size

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Survey results indicate that MaineCare providers commonly discuss behaviors with families of children enrolled in the program (Table 7). Among children whose parent reported having at least one visit with their personal doctor in the past 6 months, more than three fourths had discussed physical activity or exercise with their doctor, and over 70% had discussed nutrition and diet and sugar-sweetened drinks, and nearly 70% had discussed weight. Respondent mentions of television-viewing/other screen time lag the other obesity-related measures somewhat, at 63%. We also checked to see if children who are obese were any more likely to have discussed obesity-related behaviors with their doctor, and found a significant difference with nutrition and diet, weight, and screen time. Pediatric providers are more likely to discuss these issues with obese children and their families in an effort to encourage healthy behaviors.

¹⁷ Available at: <http://www.maine.gov/dhhs/oms/provider/childrens.html>

¹⁸ Respondents who said their child who had not visited a doctor in the past 6 months, and those who said their child does not have a personal doctor were not asked this series of questions.

In addition to obesity-related questions we asked parents if their child's provider discussed using tobacco products, risks of second hand smoke, drug or alcohol use, mental health and reproductive health. (Questions about use of tobacco products, drug/alcohol use, and reproductive health were only asked if the child was age 8 or older.) Nearly 70% of parents report that providers discussed risks of second hand smoke. Fewer talked about use of tobacco products (57%) and drug or alcohol use (52%). Just over 50% of parents indicate that their child's provider discussed mental health, while only 44% mentioned reproductive health.

Childhood Obesity

To determine the weight status of children with MaineCare coverage, we asked parents to report the height and weight of their children; we then used Centers for Disease Control (CDC) guidelines to calculate the body mass index (BMI) and their BMI-for-age percentile ranking based on growth charts for both boys and girls.¹⁹ The CDC classifies weight status according to the following table:

Weight status category	BMI age and sex-specific percentile range
Underweight	Less than the 5 th percentile
Healthy weight	5 th percentile to less than the 85 th percentile
Overweight	85 th to less than the 95 th percentile
Obese	Equal to or greater than the 95 th percentile

Overall, more than one fourth of children with MaineCare coverage (28%) are calculated to be obese, and 46% are obese or overweight. These results are not significantly different from 2011. We found no significant differences in rates of obesity by age, or by region of residence.

Table 8. Body Mass Index

Composite/Item	Results		
	n	%	95% CI
<i>Parent-reported BMI</i>			
Underweight (< 5th percentile)	868	6%	(4% - 8%)
Normal weight (5th - 84th)	868	49%	(44% - 53%)
Overweight (85th - 94th)	868	18%	(15% - 22%)
Obese (95th percentile)	868	28%	(23% - 32%)

n = unweighted sample size

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Dental Services and Unmet Need for Care

The MaineCare program has identified oral health and ensuring access to dental care as a priority, so several questions related to dental services were included in the 2012 survey (Table 9). We found that nearly two-thirds (63%) of all children enrolled in MaineCare had received dental services in the past six months, and about one in five (22%) had more than one visit with a dental provider. The overall rating of the child's dental care was quite high, with a mean score of 8.8 (out of 10), and a 69% Top Box score. This was more favorable than the Top Box rating of 62% given by respondents for all of their child's health care (see Table 3).

Parents reported that a majority of children have a usual source of dental care (79%), measured using the question: "Is there a particular dentist or dental clinic that [your child] usually goes to if he/she needs dental care or dental advice?" Having a usual source of dental care was less common among children ages 5 or younger (62%), relative to children ages 6 – 12 and teens, who had rates of 91% and 86%, respectively.

Fourteen percent (14%) of children with MaineCare coverage had dental care that was delayed or not received at some time in the past 6 months. Based on the sample weights, this translates into an estimated 15,500 children with unmet need for dental care statewide. We found no significant differences in the prevalence of unmet dental needs by age, MaineCare eligibility, or region of residence. When asked for the main reason why their child's dental care was delayed, nearly half (47%) said it was because the dental provider refused to accept MaineCare, and other 9% said they could not afford to pay for care.

Among the 44 respondents who provided some "other reason" why their child's dental care, tests, or treatments were delayed, 24 reported scheduling difficulties as a result of waiting lists or overbooking at their child's dentist's office. Others indicated that the dentist's office did not return calls promptly (n=4), would not reschedule due to previous cancellations (n=2), or that lack of transportation was the primary reason (n=2).

Table 9. Rating of Dental Care and Prevalence of Unmet Need

Composite/Item	Results		
	n	%	95% CI
<i>Any Dental Care</i>			
Child received care from a dentist/dental clinic in past 6 months	1016	63%	(59% - 67%)
<i>Number of Visits to Dentist/Dental Clinic (past 6 mo)</i>			
None	1016	37%	(33% - 41%)
1	1016	41%	(37% - 45%)
2 - 4	1016	18%	(15% - 21%)
5 or more	1016	4%	(2% - 5%)
<i>Overall Rating of Dental Care</i>			
Rating of all child's dental care (% responding 9 or higher on 10 point rating scale)	694	69%	(64% - 74%)
<i>Usual source of Dental Care</i>			
Particular dentist or dental clinic child goes to for dental needs or advice (All ages)	867	79%	(75% - 83%)
Age 5 or younger	242	62%	(53% - 70%)
Ages 6 - 12	368	91%	(87% - 95%)
Age 13 or older	257	86%	(81% - 91%)
<i>Unmet Need for Dental Care</i>			
Dental care delayed or not received at some time in past 6 months	1015	14%	(11% - 17%)
<i>Reasons for Unmet Need for Dental Care</i>			
Dental provider refused MaineCare	104	47%	(33% - 60%)
Could not afford care	104	9%	(2% - 16%)
MaineCare would not cover care	104	4%	(0% - 10%)
Did not know where to get care	104	1%	(0% - 3%)
Other reason	104	39%	(26% - 52%)

n = unweighted sample size

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Tobacco Use and Environmental Tobacco Smoke

The health risks of smoking are well-known, and environmental tobacco smoke (ETS) has been shown to increase the likelihood of asthma exacerbations in pre-school children.²⁰ Parents of children aged 8 or older were asked whether their child used tobacco products. No children under the age of 13 were reported as smoking or using tobacco. The estimated rate of tobacco use among teens age 13 through 18 who are enrolled in MaineCare was 6% (Table 10). By comparison, results from the 2009 Youth Risk Behavior Survey from Maine, a survey where teens self-report their smoking behavior, showed that 18.1% (17.0 – 19.1%) of high school students currently smoke cigarettes.²¹ (Smoking behavior among teens is likely underreported by parents participating in the MaineCare survey due to social acceptability bias.)

We also asked how many people smoke or use tobacco products in the home. An estimated 40% of all children with MaineCare coverage live in a household with at least one adult smoker. This rate is substantially higher than the national rate of household tobacco use in children’s homes, which was 26% according to the 2007 National Survey of Children’s Health.²²

Table 10. Smoking Behaviors

Composite/Item	Results		
	n	%	95% CI
<i>Child smoking behavior</i>			
Child smokes or uses tobacco products (age 13+ only)	289	6%	(3% - 9%)
<i>Second-hand smoke in home</i>			
Child lives in household where 1 or more adults smoke	1020	40%	(37% - 45%)

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Affordability of Child Health Program Premiums

Parents whose children are enrolled in MaineCare through the CHP eligibility category pay monthly premiums between \$8 and \$64, depending upon family income and number of children. State and federal policymakers are interested in monitoring the extent to which this premium is burdensome to parents. The survey showed that 47% of all parents of CHP-eligible children said it was “easy” or “somewhat easy” to pay the premium. Thirty three percent expressed difficulty paying the premium. These findings are similar to results from the 2009, 2010 and 2011 surveys.

Table 12. Affordability of MaineCare premium (CHP only)

Composite/Item	Results		
	n	%	95% CI
<i>How easy or hard has it been to afford to pay the MaineCare premium?</i>			
Very or somewhat easy	322	47%	(42% - 53%)
Neither easy/hard	322	19%	(15% - 24%)
Somewhat or very hard	322	33%	(28% - 39%)

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Parent Employment Status

Interviewers asked respondents to identify the main wage earner in the household, and then asked for the employment status of that person.²³ Fifty nine percent of respondents said they were the main wage earner, and 35% identified their spouse or unmarried partner (unweighted results).

We found that children from the lowest income households – those enrolled in MaineCare under the Medicaid eligibility category – were more likely to live in a home where the main adult wage earner was unemployed, disabled, or engaged in part-time or seasonal employment (Table 13). The table and graph below illustrate similarities in the employment status between the CHP (150-200% FPL) and Medicaid Expansion (125-150% or 133-150% FPL) enrollees compared to that of the Medicaid enrollees. While 7% and 3% of CHP and Medicaid Expansion children, respectively, live with a primary wage earner who is disabled, 11% of Medicaid children live with a disabled main wage earner. The unemployment rate among the Medicaid group (14%) is more than three times the unemployment rate of CHP households (4%) but comparable to the unemployment rate among Medicaid Expansion households (13%).

²³ When necessary, interviewers explained that main wage earner refers to, “...the adult living in your home who works and earns the most each week, or if no one is working, the adult who owns or rents your home.”

Table 13. Employment Status of Main Wage Earner by MaineCare Eligibility

Item/Response	Child's Eligibility Category			All (n=1013)
	CHP (n=352)	Expansion (n=82)	Medicaid (n=579)	
<i>Work status of main wage earner in the household</i>				
Full-time	64%	46%	39%	41%
Part-time/seasonal	13%	24%	22%	22%
Self-employed	11%	14%	14%	13%
Disabled, not working	7%	3%	11%	10%
Unemployed or retired	4%	13%	14%	14%

Note: Distribution of employment status is different across eligibility categories at $p < .05$

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Parent Insurance Status

Several studies have shown that children with uninsured parents are less likely to use health care services, even when the children are insured.²⁴ Another study showed that children are more likely to use preventive services and seek care when needed when their parents are insured.²⁵ Because of the importance of parental insurance to the care received by children with MaineCare coverage, we asked respondents about their own insurance status.

The vast majority of respondents in the 2012 survey do report having some sort of insurance coverage. MaineCare is the primary source of insurance mentioned. An estimated eight out of ten (82%) MaineCare children live in a household with a parent who is also enrolled in MaineCare. Only 15% of children live with an adult who has employer sponsored coverage. An estimated 8% of children live with a parent who has other public coverage (mostly Medicare), and 7% live with a parent who is uninsured.

Table 14. Current Insurance Status of Main Wage Earner in the Household

Item/Response	Results		
	n	%	95% CI
<i>Insurance Type</i>			
MaineCare	1002	82%	(78% - 85%)
Employer coverage (through own or spouse's employer)	1011	15%	(12% - 18%)
Other public coverage (Medicare, TriCare, Dirigo)	1011	8%	(5% - 10%)
Uninsured	1011	7%	(4% - 9%)

n = unweighted sample size

Percentage estimates are weighted to represent the entire population of children enrolled in MaineCare.

Percentages do not add to 100 because respondents could select more than one type of coverage.

²⁵ Davidoff, A., Dubay, L., Kenney, G. et al.(2003). The Effect of Parents' Insurance Coverage on Access to Care for Low-Income Children, *Inquiry*, 40(3), 254-68.

Access to Employer Sponsored Insurance

Taking a closer look at the availability of employer sponsored insurance to parents of children with MaineCare coverage, we found that among families where the main wage earner is employed (n=761), 46% were employed by companies that did not offer any kind of health insurance, and 16% were not eligible for coverage through their employer (Table 15). Thirty-eight percent of employed parents reported that they are eligible for coverage, and only 20% are actually enrolled in these employer sponsored programs.

Not surprisingly, we also found that availability of employer sponsored insurance is greater among higher-income families – those with children enrolled through the CHP eligibility category. More than half (54%) of main wage earners in this group are offered insurance by their employer, versus about 37% in the both the Expansion and Medicaid categories.

Among respondents who said they did not enroll in available employer coverage (n=177), 94% said the reason was the high cost of premiums, and one third (35%) said the available coverage was too limited (not shown).

Table 15. Employed Main Wage Earner's Access to ESI by Child's MaineCare Eligibility

Item/Response	Child's Eligibility Category			All (n=761)
	CHP (n=299)	Expansion (n=63)	Medicaid (n=399)	
<i>Access to Employer Sponsored Insurance</i>				
Offered, eligible, enrolled	24%	19%	20%	20%
Offered, eligible, not enrolled	30%	18%	17%	18%
Offered, not eligible	10%	23%	16%	16%
Not offered	36%	40%	48%	46%

Note: Distribution of access to employer sponsored insurance differs by eligibility category at $p < .05$
Percentage estimates are weighted to represent the entire population of children

Appendix A: MaineCare Coverage for Children

Eligibility Group	Family Income Eligibility Limits (Percent of Federal Poverty Level)			Premium Payments	Funding Source
	Children Ages 0 to 1*	Children Ages 1 to 5	Children Ages 6 to 18		
Medicaid	185%	133%	125%	No monthly premiums	Medicaid (Title XIX)
Medicaid Expansion	n/a	133--150%	125 – 150%	No monthly premiums	SCHIP (Title XXI)
Separate Child Health Program (CHP)	185 – 200%	150 -- 200%		Monthly premiums of \$8 to \$64, on sliding scale	SCHIP (Title XXI)

* Infants are not included in the target population for the purposes of this survey.

Note: Children up to age 18 with a disabling condition and monthly income up to 300% of the federal SSI income eligibility limit (approximately 225% FPL) are also eligible for MaineCare. These children are grouped with the “Medicaid” group for the purposes of the survey.

Appendix C: Survey Weights and Estimation Procedures

Constructing Weights. The purposes of survey weights are to remove bias from the sample and to allow for generalization of the findings to the whole population rather than just to those who completed interviews. Weights adjust for differences in the likelihood that a member of the target population is selected for an interview (design effects) and differences between respondents and non-respondents (nonresponse bias).

We constructed weights for the analysis of the 2012 survey using standard procedures, outlined in Table C-1. The first step is to compute the probability that a child within each stratum of the population was selected as a target child for an interview (column C). There were a total of 8 strata defined for the 2012 survey based on MaineCare eligibility category (Expansion or Medicaid versus CHP/Cubcare), presence of a chronic condition diagnosis in the MaineCare claims data, and number of children enrolled in MaineCare who live in the household (one versus multiple). The design weight, which adjusts for differences in the probability of selection, is computed as the inverse (column D). Because the CHP/Cubcare eligibility and children with a chronic condition diagnosis categories were oversampled in the sampling process – meaning that children enrolled in CHP/Cubcare and those with a chronic condition diagnosis had a higher probability of selection--the design weights for strata that include these categories are smaller.

Next, we adjusted for differences in non-response using a method suggested by Little and Vartivarian (2003).²⁶ We ran a logistic regression model predicting the likelihood that a given sample member completed an interview using age, gender, minority status and region of residence as predictors and controlling for eligibility category, chronic condition status, and number of children in the household. The nonresponse weight was computed as the inverse of the probability of response for each child generated from these regression models. Column E lists the sum of the product of the design and nonresponse weights.

The final step was to compute a poststratification weight, designed to rebalance the response data to reflect the distribution of the population. Because we know the number of children in each stratum in the original population (listed in column A), we do not need to rely on an external source of population data to compute the poststratification weight. We simply divided the population size (column A) by the combined non-response and design weight results in column E. The final weight, incorporating all of the previous adjustments, is the product of the design, nonresponse, and poststratification weights (column G). The average value of the final weight was 110.9, ranging from 12 to 465.

Estimation Procedures. Unless otherwise specified in the report, all results presented are based on weighted data, correcting for the stratified random sampling design used in the study.

All statistical tests were calculated using SAS version 9.2 with survey procedures that use the Taylor series linearization approach to account for the sample design and yield valid standard errors for the weighted data.

²⁶ Little R, Vartivarian S. On weighting the rates in non-response weights. *Statistics in Medicine*.2003;22:1589-1599.

Table C-1. 2012 Survey Weight Construction

Eligibility Category	Chronic Condition*	Children in HH	Population of Children in Stratum (A)	Number in Sample (B)	pr(being sampled) (C) = B/A	Design Weight (D) = 1/C	Sum of Design x Non-response Weights (E)	Poststratification Weight (F)= A/E	Sum of Final Weights (G) (=A)
Expansion or Medicaid	No CC	One	15,409	109	0.007	141.37	19,094.2	0.807	15,409.0
Expansion or Medicaid	No CC	Multiple	38,049	277	0.007	137.36	37,846.7	1.005	38,049.0
Expansion or Medicaid	CC diagnosis	One	20,053	428	0.021	46.85	19,810.8	1.012	20,053.0
Expansion or Medicaid	CC diagnosis	Multiple	34,747	837	0.024	41.51	34,170.4	1.017	34,747.0
CHP/Cubcare	No CC	One	957	104	0.109	9.20	745.0	1.285	957.0
CHP/Cubcare	No CC	Multiple	2,252	295	0.131	7.63	2,239.3	1.006	2,252.0
CHP/Cubcare	CC diagnosis	One	1,032	120	0.116	8.60	1,037.8	0.994	1,032.0
CHP/Cubcare	CC diagnosis	Multiple	1,648	226	0.137	7.29	1,778.4	0.927	1,648.0

TOTAL	114,147	2,396		116,722	114,147
-------	---------	-------	--	---------	---------

Note: Non-response weights were estimated using logistic regression models on sample members predicting response based on age, gender, minority status, and region of residence, and controlling for CSHCN status, household density and eligibility.

The non-response weight is equal to the inverse of the predicted probability of response for a given set of characteristics.

*Presence of chronic condition determined based on diagnosis codes in MaineCare claims.

Final Weight (FINWGT) = Design Weight x Non-response Weight x Poststratification Weight
--
